

## TrackM2M-VisTracks Malfunctions

TrackM2M-VisTracks ELD is capable of monitoring its compliance for various detectable malfunctions. At each instance when an ELD malfunction event is detected or cleared by the TrackM2M-VisTracks ELD, the ELD records the event. The recorded malfunction events are inconsistencies found while monitoring the ELD against FMCSA compliance requirements. Malfunction occurrences are indicated in the application header and in the Android notification toolbar with the letter '**M**', respectively. The following shows the list of detectable malfunctions:

- Power Malfunction
- Engine Synchronization Malfunction
- Timing Malfunction
- Position Malfunction
- Data Recording Malfunction
- Data Transfer Malfunction

Once the Malfunctions indicator '**M**' is tapped, a dialog will be displayed with a list of the detected malfunction events alongside a '**Clear**' button for each event. Tapping the **Clear button** will clear out the detected malfunction event.
